Pergunta 1

Respondida

Nota: 2,00 em 2,00

How can you create a larger cluster with more Kubernetes nodes?

- ☐ a. It is not possible since the cluster can only be deployed in a single node.
- ☐ b. Increase the value of `replicas` of pods in the `k8s-pods.tf` file.
- ☐ c. Increase the number of services in the `k8s-services.tf` file.
- ☒ d. Increase the value of `workers_count` in the `terraform.tfvars` file.

Pergunta 2

Respondida

Nota: 2,00 em 2,00

After deploying the system, you were able to retrieve information of the cluster using `kubect1`. Which command gave you the external IP of the load balancer?

- ☐ a. `kubect1 get pods`
- ☐ b. `gcloud container clusters describe guestbook`
- ☒ c. `kubect1 get services`
- ☐ d. `kubect1 get nodes -o wide`

Pergunta 3

Respondida

Nota: 2,00 em 2,00

In this lab, you specified a region to deploy your cluster across multiple zones. Why is this important?

- ☒ a. To improve resiliency to a potential outage in a single zone and ensure the application is still available in the remaining zones.
- ☐ b. To reduce the network latency for communications between the frontend and the redis-master.
- ☐ c. To ensure high availability by automatically adjusting the number of pods to match the exact number of zones.
- ☐ d. To reduce billing costs since Google automatically chooses the cheapest zones within the region specified by the user.

Pergunta 4

Respondida

Nota: 2,00 em 2,00

Analyze the structure of the `gcp_gke` and `gcp_k8s` modules. Select the correct option.

- ☐ a. The `gcp_gke` module specifies the application details and defines the services to be used.
- ☐ b. The `k8s-services.tf` file determines the node pool size of the Kubernetes cluster.
- ☒ c. The `k8s-pods.tf` file specifies the stateless pods for the redis backend and the frontend webserver.
- ☐ d. The `gcp_gke` module requires a Kubernetes provider to deploy the GKE cluster.

Pergunta 5

Respondida

Nota: 2,00 em 2,00

Which Terraform providers were used in this lab? Select all the correct **options**.

- ☐ a. `google_container_cluster`
- ☒ b. `google`
- ☐ c. `kubectl`
- ☒ d. `kubernetes`
- ☐ e. `gke`

Pergunta 6

Respondida

Nota: 2,00 em 2,00

Cloud native is...

- ☐ a. A recipe to convert a monolithic application to microservices.
- ☒ b. A software development approach aimed at building and running scalable applications fit for modern cloud environments.
- ☐ c. A principle of collaboration between software developers and IT operations.
- ☐ d. A next step of software design evolution after microservices.

Pergunta 7

Respondida

Nota: 1,33 em 2,00

Select all true statements about Kubernetes.

- ☐ a. Sidecar containers must use a different port than the main container in Kubernetes.
- ☐ b. Kubernetes hosts containers directly on the Nodes.
- ☒ c. Kubernetes Services offer persistent IP addresses.
- ☒ d. Kubernetes Pods have own IP addresses.

Pergunta 8

Respondida

Nota: 2,00 em 2,00

Select all true statements about microservices.

- ☒ a. Microservices generally tend to have more complex networking setup compared to monoliths.
- ☒ b. Microservices architecture allows to deploy and scale individual services individually.
- ☐ c. Event sourcing allows to expose IP addresses of backend services to client apps.
- ☐ d. Microservices are commonly stateful and use smart pipes for messaging.

Pergunta 9

Respondida

Nota: 2,00 em 2,00

Orchestration tools are responsible for:

- ☐ a. Building complex applications consisting of multiple containers and uploading them to the registry.
- ☐ b. Managing client-side logic of an application.
- ☒ c. Ensuring scalability, load balancing, replication, and high availability of an application.
- ☐ d. Managing persistent and ephemeral state of applications deployed in a cluster.

Pergunta 10

Respondida

Nota: 2,00 em 2,00

Select all container orchestration tools.

- ☒ a. Docker Swarm
- ☒ b. Kubernetes
- ☐ c. Docker Registry
- ☐ d. Docker Daemon
